Project Proposal (Proposed Solution) Report

FitBuddy AI is a smart fitness and wellness solution designed to help users build healthier daily routines through personalized guidance. The system combines user information, activity patterns, goals, and progress data to provide suitable workout and wellness recommendations. The proposed solution focuses on personalization, easy tracking, and continuous improvement of the user experience.

Project Overview

Objective: To develop an AI-assisted fitness platform that provides personalized workout guidance, activity tracking, progress monitoring, and practical wellness recommendations based on individual goals and preferences.

Scope: The project covers user profile creation, fitness-goal selection, personalized workout recommendations, activity/progress tracking, AI-assisted guidance, and a simple dashboard for monitoring fitness activities.

Problem Statement

Description: Many people find it difficult to follow a consistent fitness routine because generic workout plans may not match their goals, activity level, available time, or progress. Lack of personalized guidance and regular progress tracking can reduce consistency and motivation.

Impact: A personalized digital fitness assistant can make workout planning more accessible, support routine building, and help users understand their progress through organized activity and goal tracking.

Proposed Solution

Approach: FitBuddy AI uses user-provided fitness information, goals, preferences, and activity history to generate personalized fitness suggestions. The system can adapt recommendations as users record activities and progress.

Key Features:

- AI-assisted personalized workout recommendations.
- User profile and fitness-goal management.
- Daily/weekly activity and progress tracking.
- Adaptive recommendations based on recorded progress.
- Simple dashboard for viewing goals, workouts, and progress.
- Wellness reminders and consistency support.

Resource Requirements

Resource Type	Resource	Specification / Allocation
Hardware	Computing Resources	Laptop/PC; optional GPU for AI/ML experimentation
Hardware	Memory	Minimum 8 GB RAM
Hardware	Storage	Minimum 256 GB available storage; 1 TB preferred for development/data
Software	Programming	Python
Software	Frameworks	Flask / suitable web framework
Software	Libraries	scikit-learn, pandas, numpy, matplotlib
Software	Development Environment	VS Code / Jupyter Notebook
Data	User & fitness data	Structured user profile, goals, activity and progress records

Expected Outcome

The completed FitBuddy AI solution is expected to provide users with a convenient, personalized fitness-support platform that helps them plan workouts, track activities, monitor progress, and maintain consistency.

Implementation Flow

1. User registration and profile setup → 2. Fitness goals and preferences → 3. AI-assisted recommendation → 4. Workout/activity tracking → 5. Progress analysis → 6. Updated personalized recommendations.

Project Deliverable

A functional FitBuddy AI prototype/application demonstrating personalized fitness recommendations, user and activity management, progress tracking, and a user-friendly interface.
